Lagos, Nigeria | ebubeuzor17@gmail.com | https://github.com/Ebubeuzor

TECHNICAL SKILLS

My Portfolio Website| https://ebubeuzor.github.io/ebubeportfolio/
Front End| Jquery, Javascript, NodeJS, Bootstrap, CSS, styled-components
Back End| PHP, Laravel, MySQL
Developer Tools| Git, npm

EXPERIENCE & PROJECTS

Back-End Project | Ebube Phone Store

Backend design for a single e-commerce website   Javascript | Jquery | Ajax | PHP

I had some challenges while building this project because it was the first time I ever used classes with php. I've had some experiences working with classes from other programming languages such as Java,Python and JavaScript and because of my love for Java Programming Language it was easy for me to get a good understanding of classes in php.But I have to say it was not easy building an ecommerce application simply because of my love for coding I had to learn a lot of thing first like ajax in php and how to work with json etc put it all together to build my ecommerce app.

Front-End Project | GadgetPride Ecommerce Website

Frontend design for a complete e-commerce website   JavaScript | HTML | CSS

As a front-end developer I have to admit one of my favourite things to do is to consume APIs, I have always loved it that as soon as I learnt how to consume with ajax, fetch and then and finally the latest Async await I told myself I must create a large project and because I started with frontend development and had no experience with any backend programming language I decided to create a json file that I would use to add products to my website and also add the add to cart feature to the website this was by far the most difficult part of the project but with my never give up attitude and my positive mindset I completed the project.

Front-End Project | Music Player

Frontend design for a music player   JavaScript | HTML | CSS

I have always been a music lover so I said why not just build a music player with good old Javascript I must confess it wasn't really challenging I just had fun doing this.

Back-End Api Project (COLLABORATION) | Password Valut

PHP | JavaScript | HTML | CSS

I did this with a front-end developer but I wanted to try something different so I was like why not do something different from what I am accustom to so I created an api with php and the front-end developer consumed the api and designed everything on the page I really enjoy working with people and this gave me the opportunity to do so and also build an api.

Back-End Software Engineer | Password Valut

An application where you can generate and store password easily   JavaScript | PHP

- I created this after I became very comfortable with PHP so it was quite easy I created a form stored users credentials and then gave them the ability to store their social media details so that they don't have to memorize their details for their socials account.

EDUCATION

University of NIIT- Software Engineer   2023
